Product Release Notes

NEW

Brainshark Mobile, 4.1.0

Brainshark Push and In-App Notifications

The Brainshark Mobile App now offers push and in-app notifications. Mobile app users can opt-in to receive push notifications as soon as they've been invited to take new learning and coaching activities. Users have the option to turn off push notifications but still view notifications on new activities from within the app.

Note: Logging out of the app will automatically delete any stored in-app notifications. In the next app release, all in-app notifications will always be stored until manually deleted by the user.

Add “Search” in Learning

Mobile app users can now search their enrollments and course catalog for specific courses from within the app. This search functionality utilizes the same logic that is present on the desktop experience.

Machine Analysis – View Machine Score

If Machine Analysis has been enabled for a coaching activity, mobile app users can view their overall machine score from within the app. For a more detailed experience and to view complete Machine Analysis results, we recommend accessing those activities from the desktop.

Note: To initiate Machine Analysis, please respond to those specific activities from either the desktop or the mobile browser until Machine Analysis is fully supported from within the mobile app.
